

Setting up a Samsung phone

Every setting a telecaller's phone needs, step by step, with real screenshots.

What this guide covers

Everything a Samsung phone needs so that every call a telecaller makes is recorded, uploaded and transcribed by Aura, and keeps working for months without anyone touching it. Each step shows the real screens, captured on a Samsung phone during a fresh install.

Tested on	Samsung Galaxy SM-E075F · Android 16 · One UI 8.5
App file	Aura-1.1.5-9.apk (2.57 MB). Shows on the phone as Auratel .
Signed by	CN=Aura Call Intelligence, O=Sirah Digital, C=IN
File SHA-256	7a50806663f9206430bd93d50d904f10fafe961a9f24a6f2176e3cceed57d02a
Time needed	About 10 minutes per phone

How to read the screenshots

Tap tap here. **Check** check it looks like this. **Careful** be careful, or an expected problem.

Names, phone numbers, recording file names and the Google account in the screenshots have been blurred on purpose. Older One UI versions may word some menus slightly differently. The order of the steps is what matters.

Before you start

What you need in hand

- **The phone, charged**, with a SIM that makes normal calls.
- **The phone's screen-lock PIN**. Android asks for it when you pause Play Protect (step 4), and again only if you set up the optional internet-call detection.
- **The APK file** Aura-1.1.5-9.apk. Always use the file you were given. A different build (especially a "debug" build) can never be updated later (see Troubleshooting).
- **Access to the Aura console** for the client's workspace, with permission to pair handsets. You open the pairing QR code there in step 8. It is valid for **10 minutes**, so open it only when you reach that step.
- **Internet** on the phone (Wi-Fi or mobile data).

How Aura works on a Samsung phone

Aura does not record the call itself. Samsung's own Phone app records **both sides** of every SIM call and saves the file to Internal storage > Recordings > Call. About 15 seconds after the call ends (and every 15 minutes as a backstop), Auratel picks that file up, uploads it, and the server transcribes and analyses it. Auratel also reads the phone's call log so that missed calls reach the console too.

So the three things that must stay true on the phone are: **Samsung keeps recording calls**, **Auratel can read the files**, and **Android never puts Auratel to sleep**. Most of this guide is about those three.

① Nothing happens until the phone is paired

Before step 8, Auratel imports nothing, uploads nothing and reads no missed calls. It starts only once the phone is paired *and* recording is switched on for it in the console.

The steps at a glance

#	Step	Where
1	Turn on Samsung's automatic call recording (All calls)	Phone app
2	Copy the APK onto the phone	PC / WhatsApp / Drive
3	Install it from My Files	My Files
4	If Google Play Protect blocks it: pause scanning, install again	Play Store
5	Open Auratel and allow the five permissions	Auratel
6	Enter the telecaller's name	Auratel
7	Give All files access; check the recordings folder is found	Auratel > Settings
8	Pair the phone by scanning the console's QR code	Auratel + console
9	Stop Android putting Auratel to sleep	Settings > Apps / Battery
10	Let Auratel install its own updates	Settings > Apps
11	Turn Play Protect back on	Play Store
12	Make a test call and check it arrives	Phone + console
-	Optional: detect WhatsApp / internet calls	Settings > Accessibility

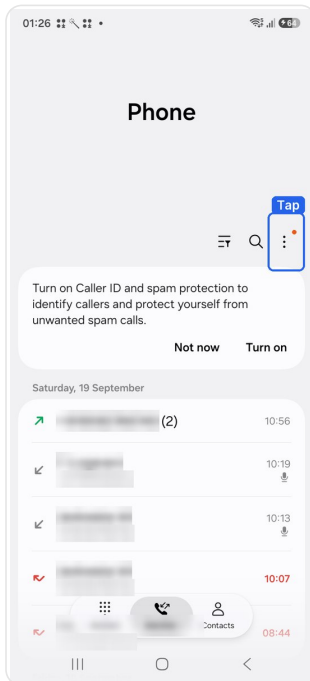

1

Turn on Samsung's automatic call recording

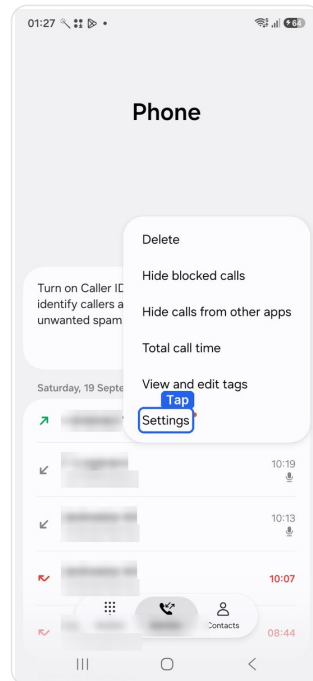

Phone app > : > Settings > Record calls > Auto record calls

This is the most important step. Auratel uploads the recordings that Samsung's Phone app makes. If Samsung is not recording, there is nothing to upload and every call arrives in the console without audio.

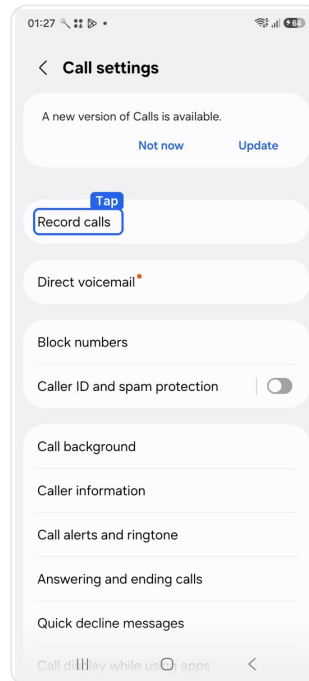

1. Open the **Phone** app and tap : (top right).
2. Tap **Settings**.
3. Tap **Record calls**.
4. Tap the words **Auto record calls** (not only the switch). Make sure it is **On** and **All calls** is selected.

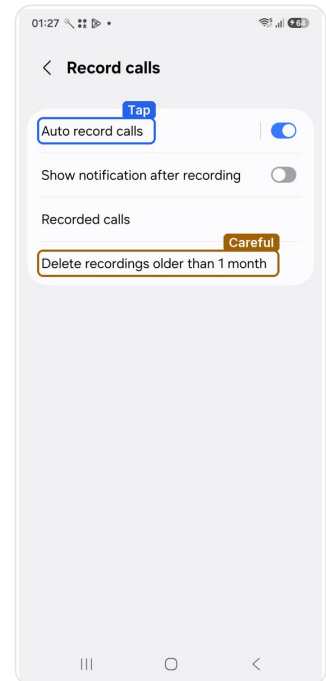

1 Phone app: tap :

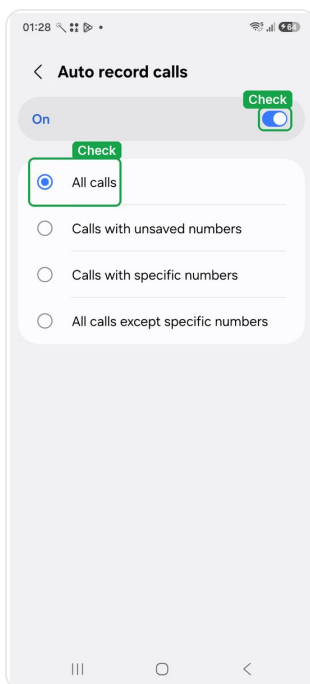

2 Tap Settings

3 Tap Record calls

4 Tap Auto record calls

5 On, and All calls

⚠ Don't tap "Delete recordings older than 1 month"

It isn't a setting. It is a button that deletes Samsung's recordings as soon as you tap it. Calls that were already uploaded are safe in Aura, but anything not yet uploaded is lost.

ⓘ Don't choose "Calls with unsaved numbers" or "specific numbers"

Those options leave calls unrecorded. Customers are often saved as contacts, so "unsaved numbers" quietly misses repeat callers. Always pick **All calls**.

2

Copy the APK onto the phone

Any of these routes works; the file should end up in Downloads

- **USB cable:** connect the phone, choose *File transfer* on the phone, and copy the APK into the phone's Download folder.
- **WhatsApp / email / Google Drive:** send the APK to the phone and download it. It lands in Download.

ⓘ Whichever app you open the APK from needs one extra permission

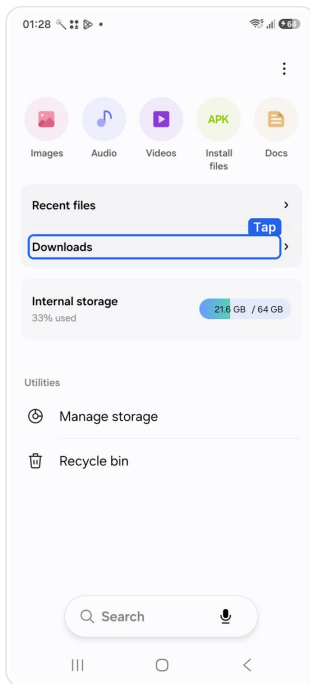

This guide opens it from **My Files**, so My Files is the app that asks for "Install unknown apps" in step 3. If you tap the APK inside WhatsApp or Chrome instead, the same question comes up for that app.

3

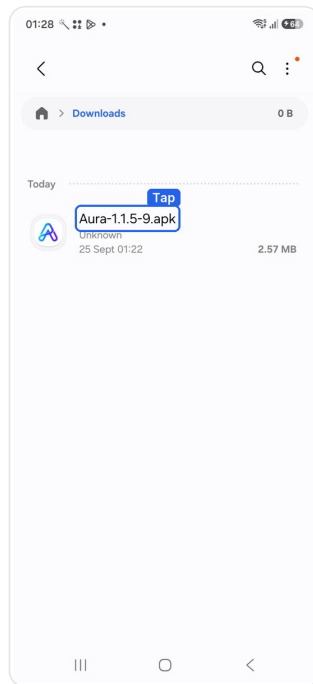

Install it from My Files

My Files > Downloads > Aura-1.1.5-9.apk

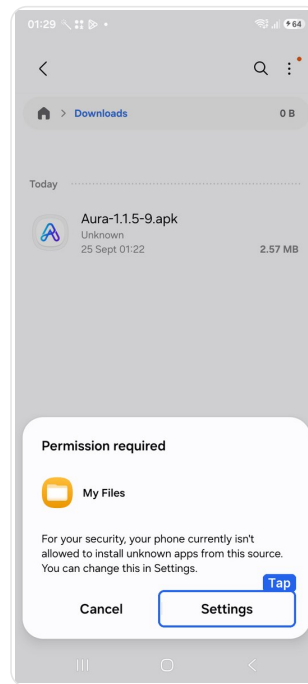

1. Open **My Files** and tap **Downloads**.
2. Tap **Aura-1.1.5-9.apk**.
3. The first time, Samsung says *"For your security, your phone currently isn't allowed to install unknown apps from this source."* Tap **Settings**.
4. Turn on **Allow permission**. The install screen opens straight away.
5. On *"Install this app? Auratel"* tap **Install**.

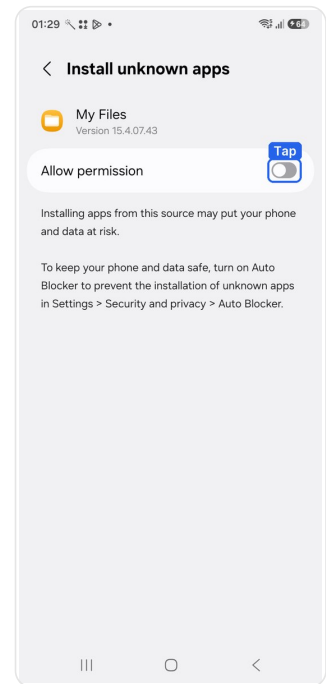

1 My Files: tap Downloads

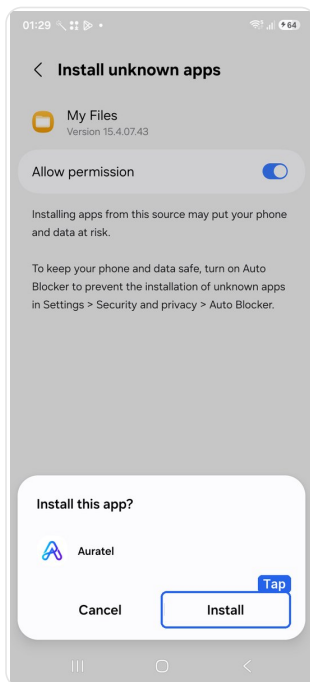

2 Tap the APK

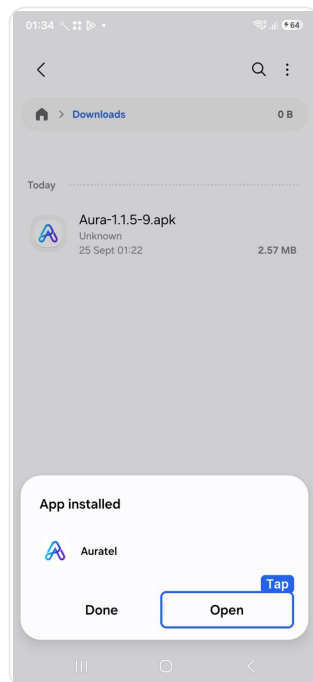

3 "Permission required": tap Settings

4 Allow permission (for My Files)

5 Tap Install

6 Success: App installed

If you see **App installed**, skip step 4 and tap **Open** (step 5). If instead you see *"App blocked to protect your device"*, do step 4.

⚠ Samsung Auto Blocker

If the install is refused outright and you never see the permission screen above, Samsung's **Auto Blocker** is on. Turn it off in Settings > Security and privacy > Auto Blocker (screenshot in Troubleshooting), install, then turn it back on if the client wants it.

4

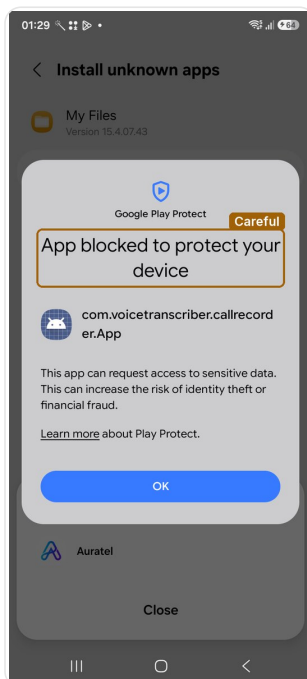

If Google Play Protect blocks the install

Play Store > profile picture > Play Protect > ⚙ > pause scanning

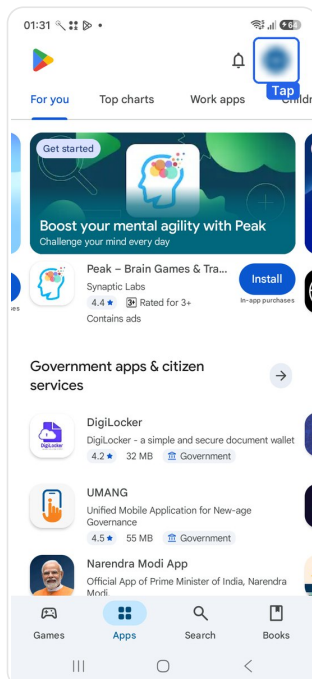

On this phone, the first install attempt was refused by Google with *"App blocked to protect your device"* and only an **OK** button. There is no *"Install anyway"*. Tapping OK gives *"App not installed"*.

This is Google's fraud protection for India. It blocks apps installed from outside the Play Store when they ask for sensitive access. Auratel reads the call log and all files, and has an accessibility service for internet calls, so it trips the check. Nothing is wrong with the file. The fix is to pause Play Protect scanning for the install, then turn it back on (step 11).

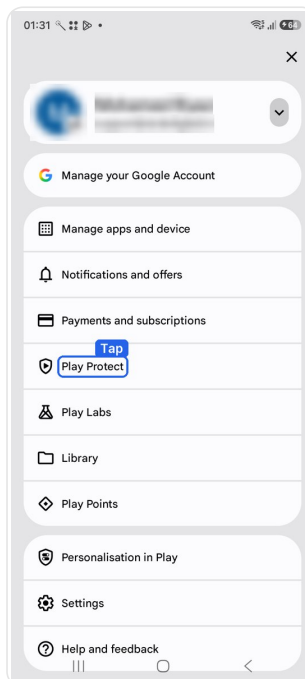

1. Open the **Play Store** and tap your **profile picture** (top right).
2. Tap **Play Protect**.
3. Tap the **settings gear** ⚙ (top right).
4. Tap the switch next to **Scan apps with Play Protect**.
5. On *"Pause app scanning instead?"* tap **Pause**, then confirm with the phone's PIN or fingerprint.
6. Go back to **My Files > Downloads**, tap the APK again, and tap **Install** (as in step 3). This time it says **App installed**.

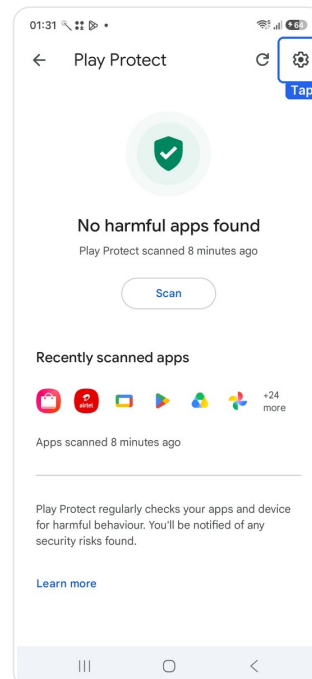

1 The block: tap OK, then Close

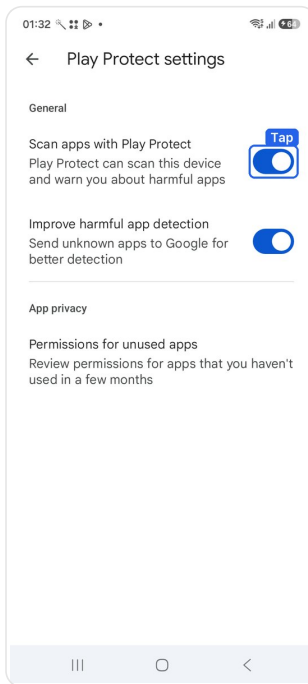

2 Play Store: tap your profile picture

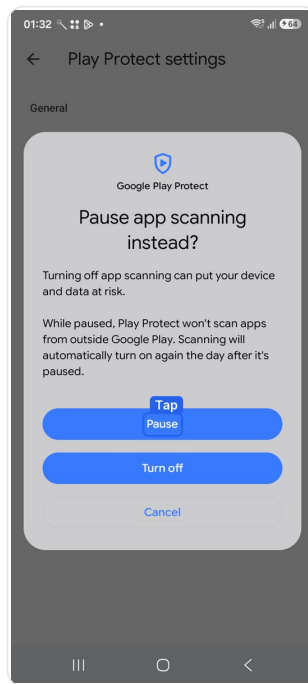

3 Tap Play Protect

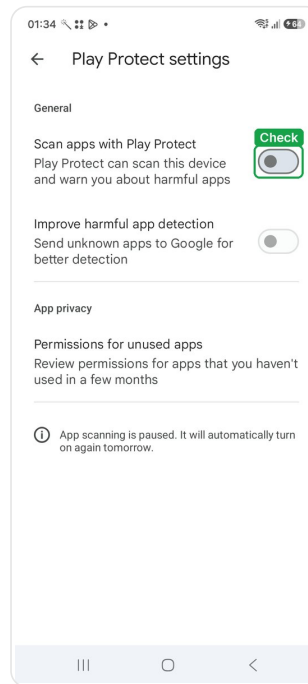

4 Tap the gear

5 Tap the Scan apps switch

6 Tap Pause (then PIN)

7 Scanning is now paused

✓ Tested: turning Play Protect back on does not remove Auratel

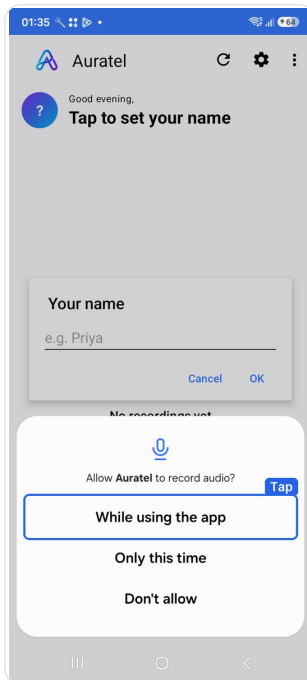

After the install we turned scanning back on and ran a full scan. The result was *"No harmful apps found"*, Auratel was listed among the scanned apps, and it stayed installed. The block only applies at install time. Pausing also ends by itself the day after, but don't leave it to that: step 11 turns it back on straight away.

5 Open Auratel and allow the permissions

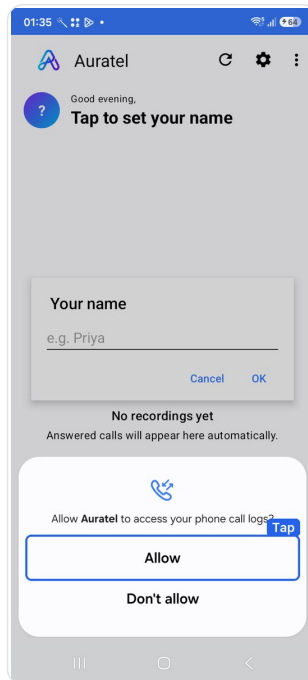

Five system prompts appear one after another the first time the app opens

Tap **Open** on the "App installed" screen (or open **Auratel** from the app drawer). Answer the prompts exactly like this:

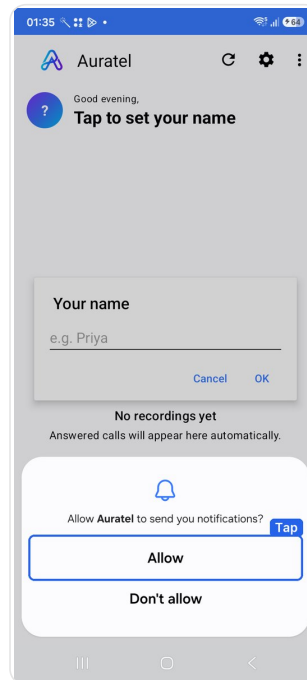

Prompt	Tap	What it is for	If refused
Allow Auratel to record audio?	While using the app	Recording internet (WhatsApp etc.) calls when that option is used	Internet-call recording doesn't work
...access your phone call logs?	Allow	Caller number and name; missed calls; matching recordings to calls	Missed calls never reach the console; numbers may be missing
...send you notifications?	Allow	Update and status notices	Updates on Android 8-11 can't prompt
...make and manage phone calls?	Allow	Knowing when a call starts and ends	Calls aren't detected
...access music and audio?	Allow	Reading Samsung's recording files	Recordings can't be read

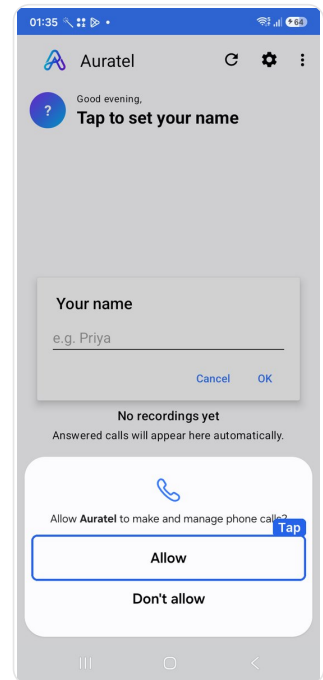

1 Microphone: While using the app

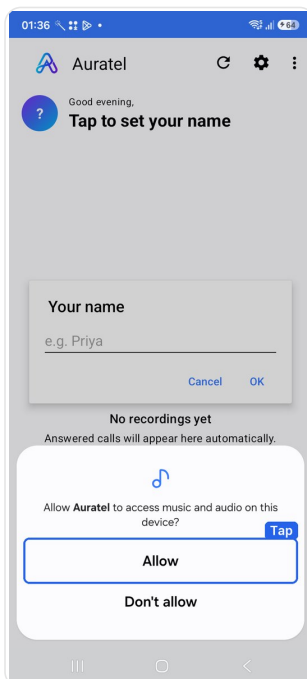

2 Call logs: Allow

3 Notifications: Allow

4 Phone calls: Allow

5 Music and audio: Allow

📌 Tapped "Don't allow" by mistake?

Fix it in Settings > Apps > Auratel > Permissions. Set Call logs, Phone, Music and audio and Notifications to **Allow**, and Microphone to **Allow only while using the app**.

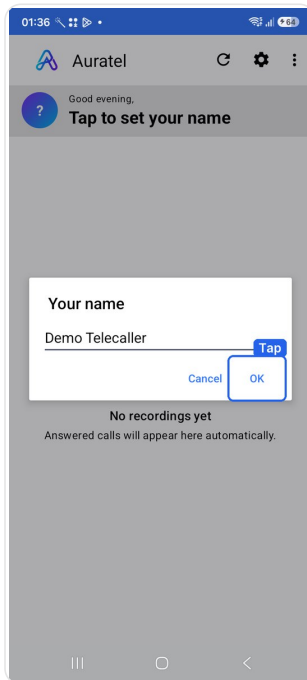

6

Enter the telecaller's name

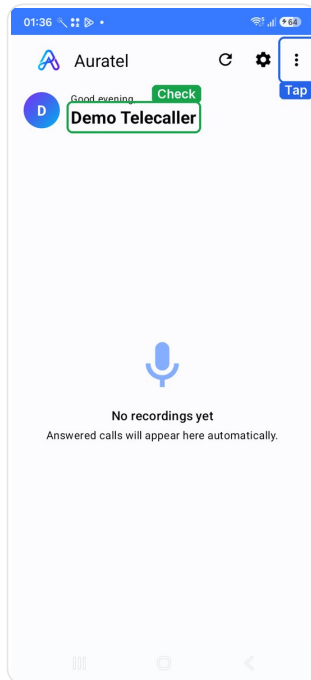

Asked once, straight after the permissions

Type the name of the person who will use this phone and tap **OK**. It greets them on the main screen and helps you recognise the handset. You can change it later by tapping the name, or via : > Profile.

The name that appears **in the console** is set there, on the Phones page. After pairing, make sure the device is assigned to the right person so calls and leads are credited to them.

1 Type the name, tap OK

2 Main screen: name shown, no recordings yet

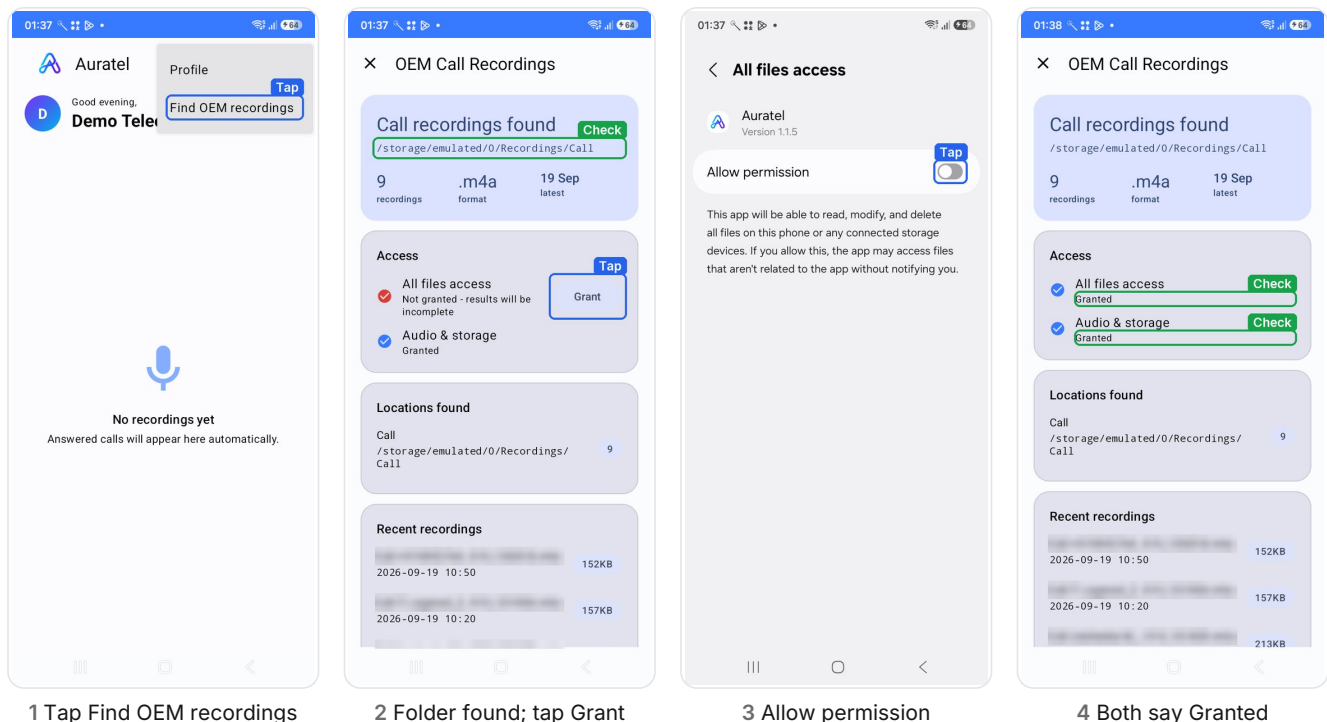

7

Give All files access and check the recordings folder

Auratel > : > Find OEM recordings > Grant

Samsung saves recordings in a normal folder that apps can only read with **All files access**. The *Find OEM recordings* screen grants that access and also shows whether Samsung is actually saving recordings, which confirms that step 1 worked.

1. On Auratel's main screen tap : (top right), then **Find OEM recordings**.
2. Check the top card says **Call recordings found** with the path `/storage/emulated/0/Recordings/Call`.
3. Next to *All files access* tap **Grant**.
4. Turn on **Allow permission**, then press Back.
5. Both *All files access* and *Audio & storage* now say **Granted**.

1 Tap Find OEM recordings

2 Folder found; tap Grant

3 Allow permission

4 Both say Granted

⚠ "No call recordings found" on a brand-new phone

That is normal if the phone hasn't recorded a call yet. Make one short call (step 1 must be done), come back here and tap **Re-scan**. If it still finds nothing, go back to step 1.

🕒 Leave "Import into app" alone

Auratel imports automatically once the phone is paired. On its first import it picks up the last **30 days** of Samsung recordings still on the phone (and the last 7 days of missed calls). If the phone holds recent personal calls that shouldn't reach the client's console, delete them in Phone > Settings > Record calls > Recorded calls **before** pairing.

8

Pair the phone with the console

Long-press the Auratel title to open the hidden Device Activation screen

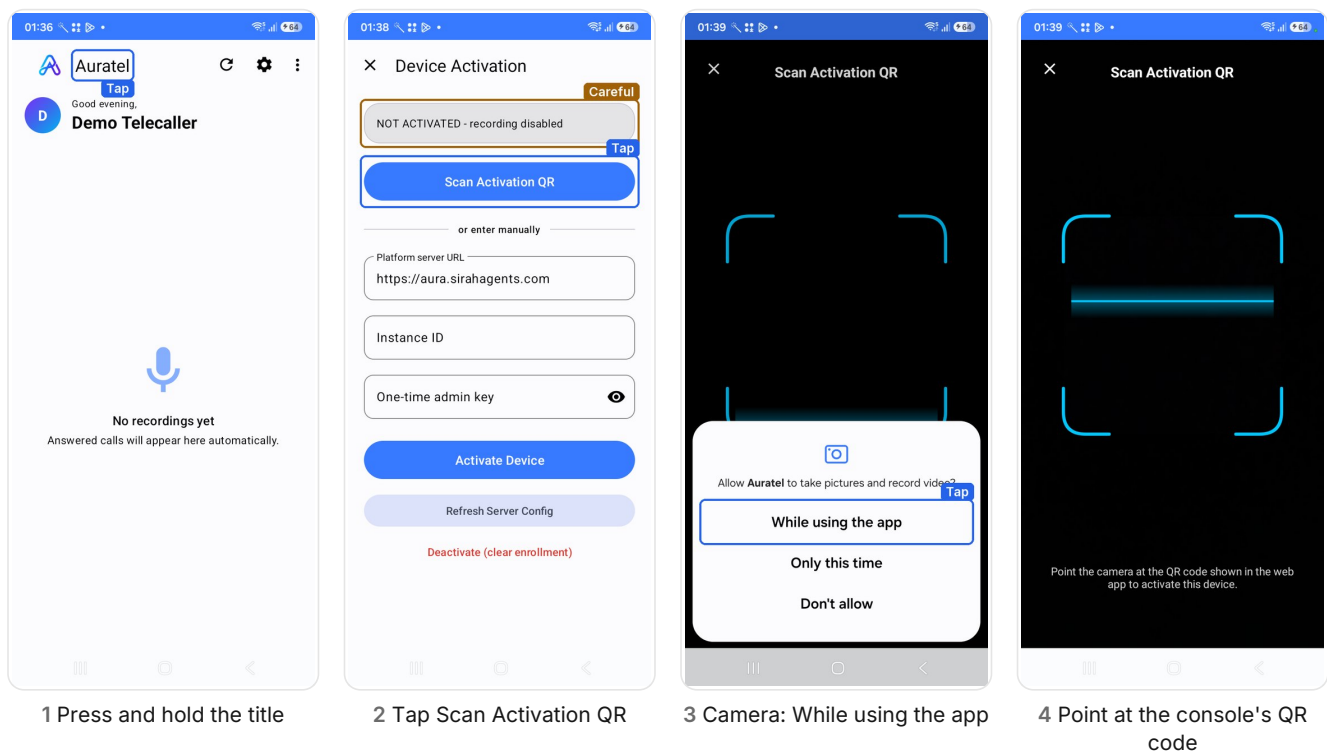

Pairing links this handset to the client's workspace. Until it's paired, the screen shows **NOT ACTIVATED - recording disabled** and the phone uploads nothing.

On the computer

1. In the Aura console open **Phones** and click **Pair a handset**. If you manage several instances, pick the right one first. A QR code appears; it's valid for 10 minutes.

On the phone

1. On Auratel's main screen, **press and hold** the word **Auratel** at the top for about a second. The **Device Activation** screen opens. This is on purpose: telecallers never see it.
2. Tap **Scan Activation QR**. The first time, allow the camera (**While using the app**).
3. Point the camera at the QR code on the computer screen.

✓ What success looks like

On the phone, the status changes from NOT ACTIVATED to activated. On the computer, the "Pair a handset" dialog switches to **Handset paired** by itself within a second or two.

In this app version, scanning activates straight away. You'll only be asked to confirm if the QR points to a different server than the one shown, or the phone is already paired to something.

⚠ Not photographed in this guide

The phone used for these screenshots was deliberately not paired to a live workspace, so the "activated" screens are described, not shown. Leave the Server URL as <https://aura.sirahagents.com>, which the QR code fills in for you.

① Other buttons on this screen

Refresh Server Config fetches the latest settings from the console immediately (normally it happens about once an hour). **Deactivate (clear enrollment)** unpairs the phone and stops all recording; only use it when retiring or re-assigning the handset.

9

Stop Android putting Auratel to sleep

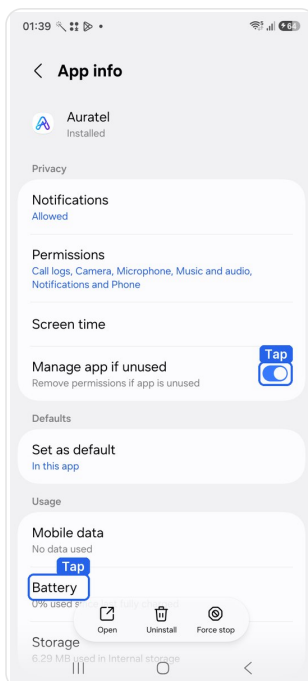

Settings > Apps > Auratel > Battery > Unrestricted

Samsung is aggressive about freezing apps that run in the background. A frozen Auratel stops uploading, and calls pile up on the phone until someone opens the app. Two settings prevent this.

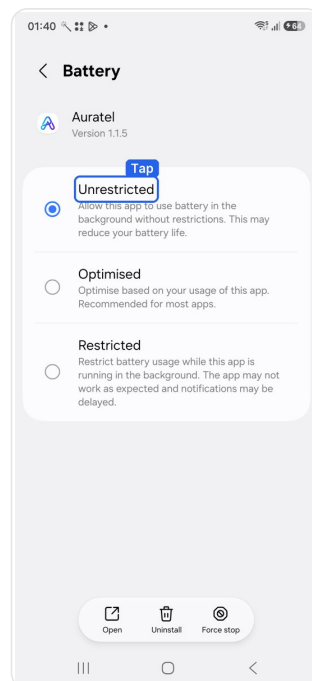

1. Open Settings > **Apps** > **Auratel** (or press and hold the Auratel icon > ① App info).
2. Turn **off** *Manage app if unused / Remove permissions if app is unused*. Telecallers rarely open Auratel, and after a few months Android would quietly take its permissions away.
3. Tap **Battery** and choose **Unrestricted**.

Then check Samsung's sleeping-apps lists

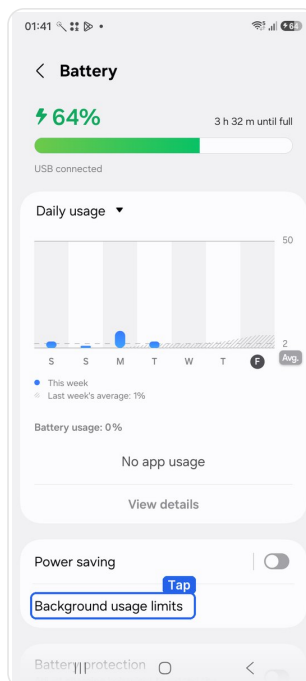

1. Settings > **Battery** > **Background usage limits**.
2. Make sure Auratel is **not** listed under *Sleeping apps* or *Deep sleeping apps*. If it is, remove it.
3. *Put unused apps to sleep* can stay as the client prefers. It won't touch Auratel now that it is Unrestricted.

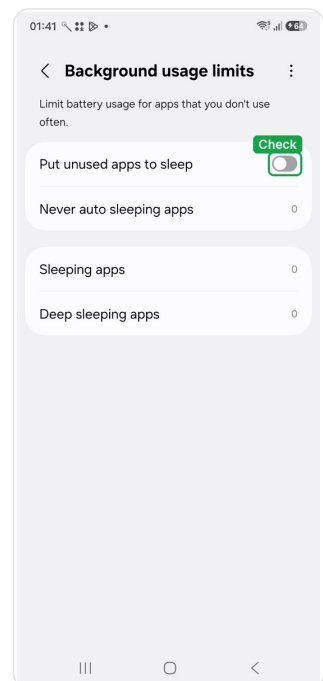

1 Turn off; then tap Battery

2 Choose Unrestricted

3 Tap Background usage limits

4 Auratel not in any sleep list

① Why Auratel isn't offered under "Never auto sleeping apps"

Once an app is **Unrestricted**, Samsung already exempts it and leaves it out of that list's "Add apps" picker. We checked: searching the picker for Auratel returns "No apps". That is expected. Unrestricted is the setting that matters.

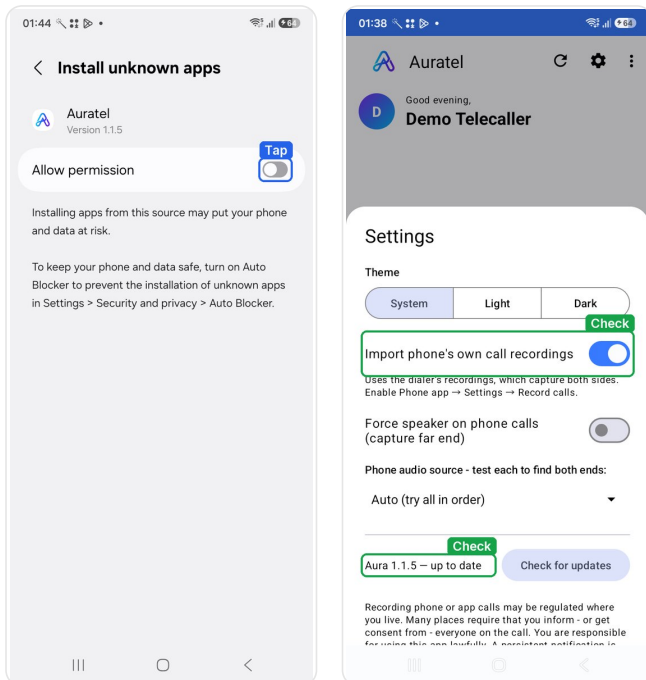

10

Let Auratel install its own updates

Settings > Apps > Auratel > Install unknown apps > Allow

Auratel isn't on the Play Store, so it updates itself: roughly every 6 hours on Wi-Fi it asks the server for a newer version, checks the file's fingerprint, and installs it. On Android 12 and newer (which includes current Samsung phones) that happens **without anyone tapping anything**, and never during a call. Android only allows that silently if this permission was already granted.

1. Settings > Apps > **Auratel** > **Install unknown apps** (it's near the bottom of App info; on some versions it's under Settings > Apps > : > Special access).
2. Turn on **Allow permission**.

1 Allow permission (for Auratel) 2 Auratel ⚙: version and Check for updates

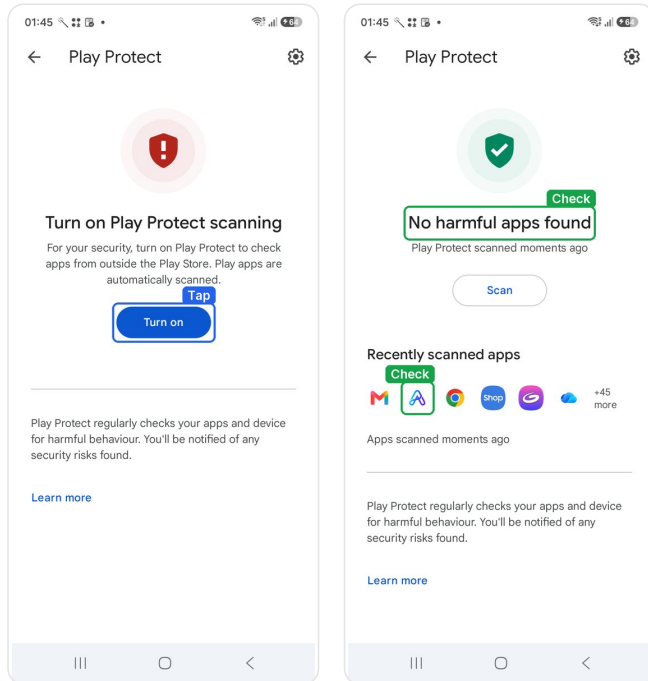

To check the version or pull an update by hand, open Auratel and tap the gear ⚙. The bottom of the Settings sheet shows *Aura 1.1.5 - up to date* and a **Check for updates** button, which also works on mobile data. The same sheet should show **Import phone's own call recordings** switched ON. Leave the other options there as they are.

11

Turn Play Protect back on

Play Store > profile picture > Play Protect > Turn on

Only needed if you paused it in step 4. Open the Play Store, tap your profile picture, then **Play Protect**, and tap **Turn on**. It runs a scan. Expect *"No harmful apps found"* with Auratel among the scanned apps.

1 Tap Turn on

2 No harmful apps; Auratel scanned

12

Make a test call and check it arrives

The only proof that the whole chain works

1. Make a normal call of about 20 seconds from this phone, and hang up.
2. Wait 15 seconds, open Auratel and **pull the list down** (or tap the refresh icon). The call appears as a new row.
3. In the console, open the calls list. The call shows up and moves on to transcribing. A transcript normally follows within a few minutes.
4. Let a call ring out unanswered on this phone and check it appears in the console as a missed call.

▲ If the call shows in the console without audio

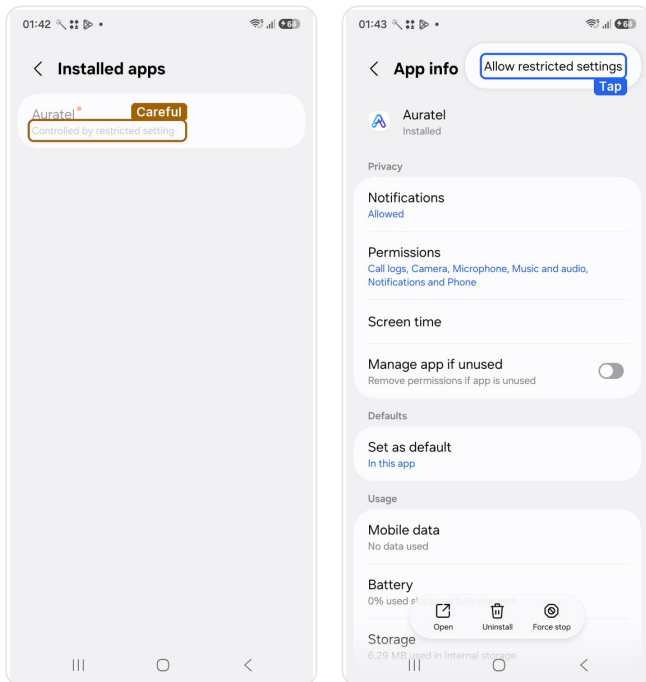

Samsung didn't record it. Go back to step 1 and check that Auto record calls is On and set to All calls.

Optional: detect WhatsApp and other internet calls

Only if this client wants internet calls captured. Normal SIM calls don't need this

Detecting internet calls uses an Android **accessibility service**. Because Auratel was installed from outside the Play Store, Android locks this with a *"restricted setting"*. Tapping it shows *"App was denied access"*. To unlock it:

1. Settings > Apps > **Auratel**, tap : (top right) > **Allow restricted settings**, and confirm with the PIN.
2. Settings > **Accessibility** > **Installed apps** > **Auratel**, and turn it on.

1 Locked: restricted setting

2 App info :: Allow restricted settings

Samsung's own recording only covers SIM calls, so audio from internet calls comes from Auratel's microphone capture. That records the telecaller's side clearly, but the other person's voice may be faint.

Final checklist

Go through this before handing the phone back. Every line should be true.

Check	Where
☐ Auto record calls is On and set to All calls	Phone > Settings > Record calls
☐ Auratel 1.1.5 is installed	Auratel > gear > bottom of sheet
☐ Call logs, Phone, Music and audio and Notifications allowed ; Microphone while using the app	Settings > Apps > Auratel > Permissions
☐ All files access Granted ; recordings folder found	Auratel > : > Find OEM recordings
☐ Phone is paired ; console shows it under Phones, assigned to the right person	Console > Phones
☐ Battery Unrestricted	Settings > Apps > Auratel > Battery
☐ "Remove permissions if app is unused" off	Settings > Apps > Auratel
☐ Install unknown apps for Auratel allowed	Settings > Apps > Auratel
☐ Play Protect scanning back on	Play Store > Play Protect
☐ Test call arrived in the console with audio	Console > Calls

What the telecaller must not do

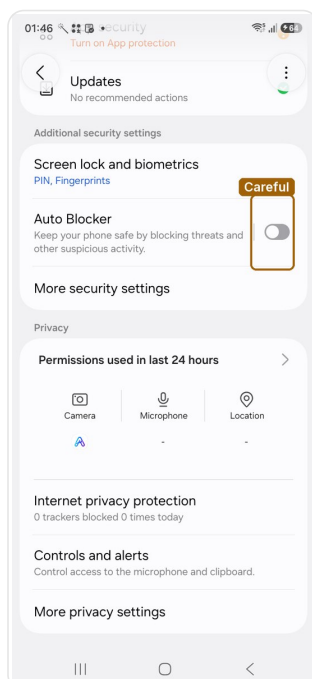

- **Uninstall Auratel, or Clear storage / Clear data** in App info. Either one unpairs the phone and deletes calls that haven't uploaded yet. Re-pairing needs a new QR code and creates a new device in the console.
- **Force stop** Auratel. Android then stops it completely: no calls are picked up or uploaded until someone opens the app again.
- Turn off **Auto record calls** in the Phone app, or switch it to "unsaved numbers".
- Tap **Delete recordings older than 1 month** in the Phone app's Record calls settings.
- Set Auratel's battery back to **Optimised** or **Restricted**, or add it to Sleeping apps.
- Delete files from Recordings > CaLL before they have uploaded.

① Mobile data

Uploads use Wi-Fi or mobile data, whichever is available. Plan on roughly **55-60 MB per hour of call audio** per phone. A busy telecaller can use a few GB a month, so check the SIM plan.

Troubleshooting

What you see	Why	Fix
"For your security, your phone currently isn't allowed to install unknown apps from this source"	The app you opened the APK from isn't allowed to install apps	Tap Settings > Allow permission (step 3)
"App blocked to protect your device" (Google Play Protect), only an OK button	Google's fraud protection for sideloaded apps	Pause Play Protect, install, turn it back on (steps 4 and 11)
Install refused with no permission screen at all	Samsung Auto Blocker is on	Settings > Security and privacy > Auto Blocker > off, install, turn back on
"App not installed as package conflicts with an existing package"	An old or differently-signed Aura build is already on the phone (usually a debug build)	See "Replacing a wrong build" below. Don't just uninstall
Find OEM recordings: "No call recordings found"	Samsung hasn't recorded a call yet, or auto-record is off	Make a test call; check step 1; tap Re-scan
"All files access: Not granted - results will be incomplete"	Step 7 not done	Tap Grant > Allow permission
Device Activation says NOT ACTIVATED after scanning	The QR code expired (10 min) or was already used	Click Pair a handset again for a fresh code and rescan
Calls stop arriving after a few days	Android put Auratel to sleep or revoked permissions	Redo step 9; check permissions; open Auratel and pull to refresh
Calls arrive in the console with no audio	Samsung isn't recording	Step 1
Accessibility: "App was denied access" / "Controlled by restricted setting"	Android locks accessibility for sideloaded apps	App info > : > Allow restricted settings (optional step)

1 Auto Blocker switch (off here)

Replacing a wrong build (for admins)

Some early handsets were set up with a **debug** build instead of the signed release. A debug build can **never** accept an automatic update, because Android rejects an update signed with a different key. Check a phone over USB with adb:

```
adb shell dumpsys package com.voicetranscriber.callrecorder | grep -E "versionCode|flags="
```

- flags=[DEBUGGABLE ...]: wrong build. It has to be uninstalled and replaced with the release APK. That unpairs the phone, so you'll need a fresh QR code, and the old device should be removed in the console afterwards.
- Before uninstalling, check nothing is waiting to upload. Any calls still pending on the phone are lost on uninstall. (The phone used for this guide had 9 pending test recordings, which were discarded on purpose.)
- flags=[HAS_CODE ALLOW_CLEAR_USER_DATA] with no DEBUGGABLE: correct release build.

How updates reach phones (for admins)

- A new APK is published from the server. Publishing **is** the rollout: every paired phone picks it up within about 6 hours (Wi-Fi only for the automatic check).
- Android 12+: installs silently, never during a call and never while Auratel is on screen; retried every 30 minutes. Android 8-11: a notification asks the user to tap.
- Each release must have a higher version code. Android never downgrades an app, so a bad release is fixed by shipping a newer one, not by rolling back.
